US-10-031-607-7 913 1 MVRLPLQCVLWGCLLTAVHP......WLCNRQAQTRLMLSVVPRIG 160 Title: Perfect score: Sequence:

Scoring table:

141681 seqs, 52070155 residues BLOSUM62 Gapop 10.0 , Gapext 0.5

Searched:

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt\_42:\* Database : Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- TISSUB SPECIFICITY: B-cells and in primary carcinomas.
-!- DISEASE: Defects in TNFRSFS are the cause of hyper-IgM immunodeficiency type 3 (HIGM3) [MIM:606843]. HIGM3 is an autosomal recessive disorder which includes an inability of B cells to undergo isotype switching, one of the final differentiation steps in the humoral immune system, an inability to mount an antibody-specific immune response, and a lack of

-!- FUNCTION: Receptor for INFSF5/CD40L.
-!- SUBUNIT: Interacts with TRAF1, TRAF2, TRAF3, TRAF5 and TRAF6 (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SUBCELLULAR LOCATION: 4 INFR-Cys repeats.
                                                                                Gaps

Biophys. Res. Commun. 253:395-400(1998).

-!-FUNCTION: Receptor for TNFSF11/RANKL/TRANCE/OFG1; essential for RANKL-mediated osteoclastogenesis. Involved in the regulation of interactions between T-cells and dendritic cells.

-!-SUBUNIT: Interacts with TRAF1, TRAF2, TRAF3, TRAF5 and TRAF6 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                similarity).
SUBCELUILAR LOCATION: Type I membrane protein (Potential).
TISSUE SPECIFICITY: UDIQUITOUS EXPRESSION WITH HIGH LEVELS IN
TRABECULAR BONE, THYMUS, SMALL INVESTINE, LUNG, BRAIN AND KIDNEY.
WEAKLY EXPRESSED IN SPLEEN AND BONE MARROW.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TUMOR NECROSIS FACTOR RECEPTOR SUPERFAMILY MEMBER 11A.

                                                                                                                                                                                                                                                             gland.

-!- DISEASE: Defects in TNPRSF11A are the cause of familial expansile osteolysis (FEO) [MIM.174810]. FEO is a rare autosomal dominant bone disorder characterized by focal areas of increased bone remodaling. The osteolytic lesions develop usually in the long bones during early adulthood. FEO is often associated with early onset deafness and loss of dentition.

-!- DISEASE: Defects in TNPRSF11A are a cause of paget disease of bone. DISEASE: Defects in TNPRSF11A are a cause of paget disease of bone. PDE2 is a bone remodelling disorder with clinical similarities to FEO. Unlike FEO, however, affected individuals have involvement of the axial skeleton with lesions in the spine, pelvis and skull.

-!- SIMILARITY: Contains 4 TNFR-Cys repeats.
                                                                         familial expansile osteolysis.";

Nat. Genet. 24:45-48(2000).

-!- FUNCTION: Receptor for TNFSF11/RANKL/TRANCE/OPGL; essential for FANKL-mediated osteoclastogenesis. Involved in the regulation of interactions between T-cells and dendritic cells.

-!- SUBGNIT: Interacts with TRAFF1, TRAFS, TRAFF5 and TRAFF.
-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).
-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).
-!- TISSUE SPECIFICITY: Ubiquitous expression with high levels in skeletal muscle, thymus, liver, colon, small intestine and adrenal

Hsu H., Solovyev I., Colombero A., Elliott R., Kelley M., Boyle W.J.;
"ATAR, a novel tumor necrosis factor receptor family member, signals through TRAF2 and TRAF5.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TWERTIVE Receptor for TNFSF14/LIGHT and homotrimeric TNFSF1/IMphotoxical and imphocyte activation. Plays an important role in HSV pathogenesis because it enhanced the entry of several wildtype HSV strains of both serotypes into CHO cells, and mediated HSV entry into activated human T cells.

-! SUBGNIT: Interacts with TRAF2, TRAF3 and TRAF2.

-! SUBCELIULAR LOCATION: Type I membrane protein (Probable).

-! TISSUE SPECIFICITY: WIDELY EXPRESSED, WITH THE HIGHEST EXPRESSION IN LUNG, SPLEEN, AND THYMUS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Herpesvirus entry mediator, a member of the tumor neorosis factor receptor (TNFR) family, interacts with members of the TNFR-associated factor family and activates the transcription factors NF-kappaB and

Gene 207:135-140(1998).
I. FUNCTION: Receptor for the heterotrimeric lymphotoxin containing LTA and LTB, and for TNFS14/LIGHT. Promotes apoptosis via TRAF3 and TRAFS. May play a role in the development of lymphoid organs.
I. SUBCELIULAR LOCATION: Type I membrane protein.
I. SUBCELIULAR LOCATION: Type I membrane protein.

Biophys. Res. Commun. 198:666-674(1994).

- I. FUNCTION: Receptor for INFSF6/FASI. The adaptor molecule FADD

- I - FUNCTION: Receptor for TNFSF6/FASI. The adaptor molecule FADD

- recruits caspase-8 to the activated receptor. The resulting death-
inducing signaling complex (DISC) performs caspase-8 proteclytic

activation which initiates the subsequent cascade of caspases

(aspartate-specific oysteine proteases) mediating apoptosis. FAS-

mediated apoptosis may have a role in the induction of peripheral

tolerance, in the antigen-stimulated suicide of mature T-cells, or

both (By similarity).

- I- SUBUNIT: Binds DAXX and RIPKI (By similarity).

- SUBUNIT: Binds DAXX and RIPKI (By similarity).

- I- SUBUNIT: Binds DAXX and RIPKI (By similarity).

- I- SUBUNIT: SONTAINS A DAXTH DOWALN INVOLVED IN THE BINDING OF FADD,

AND MAYBE TO OTHER CYTOSOLIC ADAPTOR PROTEINS.

- SIMILARITY: Contains 3 TNFR-Cys repeats.
                                                                                                                                                                                                                                                 9

"Osteoprocegorin: a novel secreted protein involved in the regulation of bone density,";

"Cell 89:309-319(1997).

-!- FUNCTION: Acts as decoy receptor for RANKL and thereby neutralizes its function in osteoclasts. Inhibits the activation of seems to depend on the local RANKL/OPG ratio, May also play a role in preventing arterial calcification. May act as decoy receptor in preventing acterial calcification. May act as decoy receptor in preventing acterial calcification. May also play a role in preventing acterial stopicials (By similarity).

-- SUBCELLULAR LOCATION: Secreted (By similarity).

-- INDUCTION: Upergulated by osteopontin.

-- INDUCTION: Opergulated by osteopontin.

-- SIMILARITY: Contains 2 death domains.
                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. Rture 356:314-317(1992).

Inducting signaling complex (DISC) performs caspase-8 proteolytic activation which initiates the subsequent cascade of caspases (asparate-specific cysteine proteases) mediating apoptosis. FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T-cells, or both (By similarity).

osteoclasts and promotes osteoclast apoptosis in vitro. Bone homeostasis seems to depend on the local RANKL/OPG ratio. May also play a role in preventing arterial calcification. May act as decoy receptor for TRAIL and protect against apoptosis. TRAIL binding blocks the inhibition of osteoclastogenesis.
                                                                                       -!- SUBCALT: Homodimer.
-!- SUBCALLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TASOUR SEPECTRICITY: Highly expressed in adult lung, heart, kidney,
liver, spleen, thymus, prostate, ovary, small intestine, thyroid,
lymph node, trachea, adrenal gland, testis, and bone marrow.
Detected at very low levels in brain, placenta and skeletal
muscle. Highly expressed in fetal kidney, liver and lung.
-!- INDUCTION: Upregulated by increasing calcium-concentration in the
medium and estrogens. Downregulated by glucocorticoids.
-!- PTM: N-04-ycosylated. Contains sialic acid residues.
-!- PTM: The N-terminus is blocked.
-!- STMILARITY: Contains 4 TNFR-Cys repeats.
-!- SIMILARITY: Contains 2 death domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            R GO; GO:0005125; F:Cytokine activity; TAS.

BY SIMILARITY.

BY SIMI
its function in osteoclastogenesis. Inhibits the activation of osteoclasts and promotes osteoclast apports in vitro. Bane homeostasis seems to depend on the local RANKI,OPG ratio. May also play a role in preventing arterial calcification. May act as decoy receptor for TRAIL and protect against apoptosis. TRAIL binding blocks the inhibition of osteoclastogenesis. TRAIL binding -: SUBUNIT: Homodimer.
-: SUBUNIT: Homodimer.
-: TISSUE SPECIFICITY: Highly expressed in liver, lung, stomach, intestines and calvaria. Highly expressed in decidua and placenta,
                                                                                                                                                                                              and in embryo.

--- DEVELOPMENTAL STACE: Detected in embryo at high levels on day 7, whereas expression decreases at day 11 and increases from day 15 to 17. On day 15 found in developing bone primordia, brachiocephalic artery and ductus arteriosus, left main bronchus, abdominal acrta and midgut.
--- INDUCTION: Upregulated by IGF-beta and estrogens. Downregulated by 1,25-dihdroxyvitamin D3 and parathyroid hormone.
--- SIMILARITY: Contains 2 death domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       N-LINKED (GLCNAC. .) The TRAF1/TRAF2 complex recruits the apoptotic suppressors BIRC2 and BIRC3 to TNFRST1B/TWFR2 (By similarity).

```
The present sequence is human CD40. It may be used in a method for preventing latent virus reactivation or controlling virus replication. The method comprises administering a composition capable of binding to a cell membrane expressed CD40, where the binding of the composition to the CD40 on the surface of the cell generates a stimulatory signal to the cell. The method is useful for treating immunocompromised patients, e.g. infected with human immunodeficiency virus (HIV), or immunosuppressed patients, e.g. of due to infections or illness, or as a side effect of treatments (such as radiation or cancer therapy), or due to tissue or organ transplantation. The method does not have the levels of toxicity seen following administration of conventional antiviral drugs
                                                                                                                                                                                                                                                                                                            Method for preventing latent virus reactivation or controlling virus replication by administration of antibodies or similar reagents which stimulate the CD40 molecule.
                                                                                                                                                                                              (LJOL-) LA JOLLA INST ALLERGY & IMMUNOLOGY.

<u>ن</u> Gentz RL, Ruben SM, Wei Y,

WPI; 2001-041051/05.

Nucleic acid encoding a TRID polypeptide, also referred to as tumor necrosis factor receptor 5, useful in the diagnosis, treatment or prevention of cancer, autoimmune disorders and viral infection.

Disclosure; Fig 2; 285pp; English.

The present invention describes the human TRID protein (tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) receptor without intracellular domain, also referred to as tumour necrosis factor receptor entracellular domain, also referred to as tumour necrosis factor receptor of (TNFR-5 or TRE)). TRID has cytostatic, immunosuppressive, nootropic, neuroprotective, antiviral, antinflammatory, anticonvulsant, nootropic, antiparasitic, cardiant, anti-HIV, antiparkinsonian and vasorropic activities, and can be used in gene therapy. The TRID polymucleotides are useful in the treatment of tumours, resistance to parasite, bacteria and viruses, restenosis and graft versus host disease. They are also useful for inducing proliferation of T-cells, endothelial cells and certain haematopoietic cells, to regulate antiviral responses and to prevent certain autoimmune diseases after etimulation of TRID by an agonist or TRAIL binding facilitator. The antibodies which bind TRID polymucleotides, proteins, antibodies, and anticasses and anticasses are useful in the diagnosis, treatment or prevention of: (a) cancer; (b) cuseful in the diagnosis, treatment or prevention of: (a) cancer; (b) cutofinders; (c) diseases ascolated with increased apoptosis; (d) cardiovascular disorders; and (e) viral infection. The present sequence represents a tumour necrosis factor receptor used in comparison with TRID in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a compounds with the tNA sequence. The method comprises generating a cavaluating in silico the binding of the virtual compounds with the tNA according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of a tNA sequence via binding of the ONS that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of compounds that modulate the expression of a tNA sequence via binding of compounds that the that. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. Novel CD40-binding non-antibody molecule, that do not cause proliferation, differentiation or activation of CD40-expressing cells but which inhibit CD40 ligand-induced activation, used to treat autoimmune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to non-antibody molecules which bind to an epitope on CD40 antigan and do not activate CD40-expressing cells, but inhibit CD40-ligand (CD40L) induced activation, and which do not interfere with the binding of CD40L to CD40. The present sequence is human CD40 antigen. CD40 is a 50 kDA type 1 membrane glycoprotein expressed on a variety of cells, including B cells. CD40 is critical for B cell function. The non-antibody molecules of the present invention are useful for treating autoimmune, cell-mediated and antibody-mediated diseases, and conditions in which immunogenic proteins are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 PCGESEFLDTWNRETHCHQHKYCDPNLGLRVQQKGTSETDTICTCEEGWHCTSEACESCV

This invention describes novel pure proapoptotic dependence peptides dependence of an active dependence domain selected from dependence bolypeptides consisting of p75NTR, androgen receptor, DCZ, huntingtin polypeptide, Machado-Joseph disease gene product, SCA1, SCA2, SCA6 and atrophin-1 polypeptide. The proapoptotic peptides are capable of inducing cell death and can be used to develop products to mediate or inhibit apoptosis. The methods can be used for reducing the severity of proapoptotic dependence domain mediated pathological conditions e.g. Spinocerebellar ataxias, dentacroubzopallidoluysian atrophy, Machado-Joseph disease, stroke or head trauma. They can also be used for reducing proliferation or cell survival e.g. neoplastic, malignant, autoimmune or fibrotic conditions. This sequence represents the human CD40 polypeptide
Alzheimer's disease; Kennedy's disease; spinocerebellar ataxia; stroke; dentatorubropallidoluysian atrophy; cell proliferation; cell survival; neoplastic; malignant; autoimmune; fibrotic; CD40.
                                                                                                                                                                                                                                                                                                                          New proapoptotic dependence peptides, used to develop products for treating, e.g. Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 170-171; 199pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to substantially pure CD40 splice variant proteins which include tail sequences. Also disclosed is a pharmaceutical composition comprising the protein and a carrier, an in vitro method of detecting whether an individual is expressing the protein, and a method for modulating CD40-CD154 interactions in an individual. The protein of the invention is useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury. The current sequence represents CD40 splice variant protein.
                                                                                                                                                                                                                                                                                                                                                                                            Protein, useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MVRLPLQCVLWGCLLTAVHPEPPTACREKQYLINSQCCSLCQPGQKLVSDCTEFTETECL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 PCGESEFLDTWARETHCHQHKYCDPNLGLRVQQKGTSETDTICTCEEGWHCTSEACESCV 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to substantially pure CD40 splice variant proteins which include tail sequences. Also disclosed is a pharmaceutical composition comprising the protein and a carrier, an in vitro method of detecting whether an individual is expressing the protein, and a method for modulating CD40-CD154 interactions in an individual. The protein of the invention is useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury. The current sequence represents CD40 splice variant protein.

                                                                                                                                                                                                                                                                 CD40; splice variant; antiinflammatory; cytostatic; antiarteriosclerotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to substantially pure CD40 splice variant proteins which include tail sequences. Also disclosed is a pharmaceutical composition comprising the protein and a carrier, an in vitro method of detecting whether an individual is expressing the protein, and a method for modulating CD40-CD154 interactions in an individual. The protein of the invention is useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury. The current sequence represents CD40 splice variant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein, useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MVRLPLQCVLWGCLLTAVHPEPPTACREKQYLINSQCCSLCQPGQKLVSDCTEFTETECL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to substantially pure CD40 splice variant proteins which include tail sequences. Also disclosed is a pharmaceutical composition comprising the protein and a carrier, an in vitro method of detecting whether an individual is expressing the protein, and a method for modulating CD40-CD154 interactions in an individual. The protein of the invention is useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury. The current sequence represents CD40 splice variant protein.
                                                                                                                           9
                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protein, useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury.
therapy procedures. The current sequence is that of the human CD40 (D1-D3)-6XHis mutant extracellular domain protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40. The anti-CD40 antibody of the invention demonstrates cytostatic, virucide, antibacterial, immunostimulant and anti-HIV activities and may be useful for treating a hyperproliferative disorder souch as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human CD40-6XHis wild-type extracellular domain protein of the invention.
                                                                                                                                                              New chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40, useful for enhancing an immune response in a human, or treating cancer, HIV, neutropenia or viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 MVRLPLQCVLWGCLLTAVHPEPPTACREKQYLINSQCCSLCQPGQKLVSDCTEFTETECL 60

The anti-CDAO antibody of the invention demonstrates cytostatic, virtoide, antibacterial, immunostimulant and anti-HIV activities and may be useful for treating a hyperproliferative disorder such as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CDAO antibodies may also be useful for detecting CDAO in a biological sample in vitro or in vivo, as well as during gene

e.g. rheumatoid arthritis, systemic lupus erythematosus, and multiple sclerosis, inflammatory diseases and graft versus host disease. Also claimed are methods for detecting the presence of a variant CD40R in a sample, for determining the level of variant CD40R in a sample, and for determining the ratio between the level of a CD40R variant acid and the level of criginal CD40R, and a method for identifying candidate compounds capable of binding to a CD40R variant and afficity of the variant to a CD40R ligand

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to substantially pure CD40 splice variant proteins which include tail sequences. Also disclosed is a pharmaceutical composition comprising the protein and a carrier, an in vitro method of detecting whether an individual is expressing the protein, and a method for modulating CD40-CD154 interactions in an individual. The protein of the invention is useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury. The current sequence represents CD40 splice variant protein.
                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                       9

The present sequence is that of a novel splice variant of the human CD40 receptor (CD40R). The variant has the extracellular domain of the native protein from the signal peptide up to the amino acid before the transmembrane region. 6 Novel splice variants (see AAB20169-74) of human and murine CD40R, nucleic acids (see AAB30275-80) encoding them, and murine CD40R, nucleic acids (see AAB30275-80) encoding them, and murine CD40R, nucleic acids (see AAB30275-80) encoding them, as a pharmaceutical composition consisting of a variant CD40R polypeptide is a pharmaceutical composition consisting of a variant CD40R polypeptide for treatment of diseases which can be ameliorated, cured or prevented by increasing the level of a CD40R variant; antibodies can be used to reduce the level of a CD40R variant; antibodies can be used to reduce the level of a CD40R variant; antibodies can be used to reduce the level of a CD40R variant of lugus erythematosus, and multiple sclerosis, inflammatory diseases and graft versus host disease. Also claimed are methods for determining the presence of a variant CD40R in a sample, and for determining the ratio between the level of a CD40R variant acid and the level of original CD40R, and a method for identifying candidate compounds

amino acids. In addition, there is a 9-amino acid insert at position 86 of the original protein, instead of the original Asn. The variant is missing part of TNRR Cys repeat 4, the transmembrane domain and the cytoplasmic domain. 6 Novel splice variants (see AAB20169-74) of human and murine CD40R, nucleic acids (see AAF30275-80) encoding them, expression vectors, host cells and anti-CD40R antibodies are claimed. Also claimed is a pharmaceutical composition consisting of an expression vector comprising a CD40R nucleic acid, for treatment of diseases which can be ameliorated, cured or prevented by either decreasing the level or of at least 1 ligand of CD40R, by increasing the level of a CD40R variant, or by reducing the level of a CD40R variant. The diseases in challed autoimmune diseases e.g. rheumatoid arthritis, systemic lupus erythematosus, and multiple sclerosis, inflammatory diseases and graft versus host disease. Also claimed are methods for detecting the presence of a variant nucleic acid sequence of CD40R in a sample, for determining the level of variant nucleic acid sequences of CD40R in a sample, and for determining the level of the original CD40R, e.g. using a nucleic acid chip ö 180 420 480 480 540 540 099 120 TGCCAGCCAGGAAGCCGACTGACAAGCCACTGCACAGCTCTTGAGAAGACCCAATGCCAC 180 CCATGTGACTCAGGCGAATTCTCAGCCCAGTGGAACAGGGAGATTCGCTGTCACCAGCAC 240 CCATGTGACTCAGGCGAATTCTCAGGCCCAGTGGAACAGGGAGATTCGCTGTCACCAGCAC 240 AGACACTGTGAACCCAGTGCGTGGGGCTGCCTGGGAAGGGATCAAGGGCTTCGGGTTAAG 300 420 600 600 660 GGGCAGTGTTTACGTGCAGTGACAACAGTACCTCCACGATGGCCAGTGCTGTGTTTTG 120 241 AGACACTGTGAACCCAGTGCGTGGGCTGCCTGGGAAGGGGATCAAGGGCTTCGGGTTAAG 300 9 TGCCAGCCAGGCAAGCCGACTGAAGCCACTGCACAGCTCTTGAGAAGACCCAATGCCAC 1 ATGGTGTCTTTGCCTCGGCTGTGCGCGCTATGGGGCTGCTTGTTGACAGCGGTCCATCTA CTATATCAAAAAGGTGGTCAAGAACCAAAGGATAATGAGATGTTACCCCCTGCGGCTCG CTATATCAAAAAGGTGGTCAAGAAACCAAAGGATAATGAGATGTTACCCCCTGCGGCTCG GGGCAGTGTGTTACGTGCAGTGACAACAGTACCTCCACGATGGCCAGTGCTGTGATTTG 361 AGCAAGGATTGCGAGGCATGTGCTCAGCACGCCCTGTATCCCTGGCTTTGGAGTTATG AGCAAGGATTGCGAGGCATGTGCTCAGCACACGCCCTGTATCCCTGGCTTTGGAGTTATG AATCAGTCATCACTTTTCGAAAAGTGTTATCCCTGGACAAGGTTTAAAGTCCCGGATGCG GAGATGGCCACTGAGACCACTGATACCGTCTGTCATCCCTGCCCAGTCGGCTTCTTCTCC 421 GAGATGGCCACTGAGGCCACTGATACCGTCTGTCATCCCTGCCCAGTCGGCTTCTTCTCC AATCAGTCATCACTTTTCGAAAAGTGTTATCCCTGGACAAGGTTTAAAGTCCCGGATGCG 541 AGCCCTGCTGGTCATTCCTGTCGTGATGGGCATCCTCATCACCATTTTCGGGGTGTTTCT AGCCCTGCTGGTCATTCCTGTCGTGATGGGCATCCTCATCACCATTTTCGGGGTGTTTCT Gaps ·; 100.0%; Score 809; DB 4; Length 809; .larity 100.0%; Pred. The present sequence is that of mouse cDNA encoding splice variant McdAAlt8 (see AAB20172) of the mouse CD40 receptor (CD40R). The variant contains 165 N-terminal amino acids of the original CD40R sequence including tumour necrosis factor receptor (TNFR) Cys repeats 1, 2 and 3, acids I.t is missing part of TNFR repeat 4, the transmembrane domain and the cytoplasmic domain. 6 Novel splice variants (see AAB20169-74) of human and murine CD40R, nucleic acids (see AAF30275-80) encoding them, expression vectors, host cells and anti-CD40R antibodies are claimed. Also claimed is a pharmaceutical composition consisting of an expression vector comprising a CD40R nucleic acid, for treatment of diseases which can be ameliotrated, cured or prevented by either decreasing the level or of at least 1 ligand of CD40R, by increasing the level of a CD40R variant, or by reducing the level of a CD40R variant. The diseases include autoimmune diseases e.g. rheumatoid arthritis, systemic lupus include autoimmune diseases e.g. rheumatoid arthritis, systemic lupus erythematosus, and multiple sclerosis, inflammatory diseases and graft versus host disease. Also claimed are methods for detecting the presence of cavinat nucleic acid sequence of CD40R in a sample, for determining the level of the original CD40R, e.g. using a nucleic acid chip 721 GGAGACACTGCACGGGTGTCAGCCTGTCACAGGAGGAGGATGGTAAAGAGAGTCGCATCTC 780 Nucleic acid encoding alternative splicing variant of CD40 receptor, useful for treating inflammatory diseases, autoimmune diseases, and graft GGAGACACTGCACGGGTGTCAGCCTGTCACACAGGAGGATGGTAAAGAGAGTCGCATCTC 780 CD40 receptor; CD40R; mouse; splice variant; antiinflammatory; immunosuppressive; antiarthritic; antirheumatic; dermatological; neuroprotective; gene therapy; diagnosis; ss. probes that are immobilised on a solid support, where the array comprises at least 10-20 probes having sequences selected from the 29 sequences of 192-4655 base pairs given in ABC7481 to ABC74511. Also described is a method for selecting DNA sequences for a non-redundant microarray, comprising: (a) providing sequence databases; (b) screening the databases specific for a species and a tissue found in the sequences specific for a species and a tissue found in the sequences from the list to generate a non-redundant cluster list; (d) categorising selected sequences from non-redundant cluster list; (d) categorising selected sequences from non-redundant cluster list; (d) based on the characteristics used to establish the parameters of the module list. The composition comprising the microarrays is useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                           solid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diagnostic and screening procedures involving immunologically-based sample materials. It is used in experiments and screens in innate and adaptive basic immunology, tumour immunology, cancer biology of immunocalls, aging, drug testing, infection immunology, autoimmune diseases, arthritis, allergy, and vaccine development against these diseases. The composition and method may be used in monitoring the progression of a particular disease, in screening drug treatments for diseases, and in toonstruction of non-redundant DNA microarrays for different species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ATGGTGTCTTTGCCTCGCTGTGCGCGCTATGGGGCTGCTTGTTGTTGACAGCGGTCCATCTA

The present sequence is that of mouse CDNA encoding splice variant

CC contains 16S N-terminal amino acids of the original CD40R sequence

CC contains 16S N-terminal amino acids of the original CD40R sequence

including tumour necrosis factor receptor (TNRR) Cys repeats 1, 2 and 3,

cc acids. It is missing part of TNRR repeat 4, the transmembrane domain and

CC acids. It is missing part of TNRR repeat 4, the transmembrane domain and

CC acids. It is missing part of TNRR repeat 4, the transmembrane domain and

CC the cytoplasmic domain. 6 Novel splice variants (see AAB20169-74) of

the cytoplasmic domain. 6 Novel splice variants (see AAB20169-74) of

Novel splice variants of the consisting of an expression vector comprising a CD40R nucleic acid, for treatment of diseases which

CC an be ameliorated, cured or prevented by either decreasing the level or

CC can be ameliorated, cured or prevented by either decreasing the level or

CC fat least 1 ligand of CD40R, by increasing the level of a CD40R

CC variant, or by reducing the level of a CD40R variant. The diseases

CC include autoimmune diseases e.g. rheumatoid arrhitis, systemic lupus

CC variant, or by reducing the level of a CD40R variant. The diseases

CC include autoimmune diseases e.g. rheumatoid arrhitis; systemic lupus

CC variant nucleic acid sequences of CD40R in a sample, for determining

CD the level of variant nucleic acid sequences of CD40R in a sample, and for

CC and the level of the original CD40R, e.g. using a nucleic acid chip
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of mouse CDNA encoding splice variant Mcd40-

DFB1-1-5 (see AAB20171) of the mouse CD40 receptor (CD40R). The variant

contains 135 N-terminal antho acids of the original sequence including

tumour necrosis factor receptor (TDRE) Cys repeats 1 and 2, and part of

missing the TNFR repeat 4, part of repeat 3, the transmembrane domain and

the cytoplasmic domain. 6 Novel splice variants (see AAB20165-74) of

human and murine CD40R, mucleic acids (see AAB202165-74) of

human and murine CD40R, mucleic acids (see AAB202165-74) of

human and murine CD40R, mucleic acids (see AAB202165-74) of

human accounting composition consisting of an expression vector.

comprising a CD40R nucleic acid, for treatment of diseases which can be

ameliorated, cured or prevented by either decreasing the level or of at

last 1 ligand of CD40R, by increasing the level of a CD40R variant, or

by reducing the level of a CD40R variant. The diseases include autoimmune

cultiple sclenosis, inflammatory diseases and graft versus host disease.

Also claimed are methods for detecting the presence of a variant nucleic

acid sequence of CD40R in a sample, for determining the level of variant

nucleic acid sequences of CD40R variant nucleic acid and the level of

ratio between the level of a CD40R variant nucleic acid and the level of

the original CD40R, e.g. using a nucleic acid chip
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid encoding alternative splicing variant of CD40 receptor, useful for treating inflammatory diseases, autoimmune diseases, and graft versus host reaction.

The present invention describes a composition comprising an array of cDNA probes that are immobilised on a solid support, where the array comprises at least 10-20 probes having sequences selected from the 29 sequences of 12-4655 base pairs given in ABC/4483 to ABC/4511. Also described is a method for selecting DNA sequences for a non-redundant microarray, comprising; (a) providing sequence databases; (b) screening the databases of pecies to generate a redundant sequence list; (c) removing redundant sequences from the list to generate a non-redundant cluster list; (d) categorising selected sequences from non-redundant cluster list into at least one module list; and (e) selecting the best representative clones based on the characteristics used to establish the parameters of the module list. The composition comprising the microarrays is useful in diagnostic and screening procedures involving immunologically-based sample materials. It is used in experiments and screens in innate and
                                                                                                                                                                                                                                                       New composition comprising an array of cDNA probes immobilized on a solid support, useful for diagnostic and screening procedures involving immunologically-based sample materials, drug testing or monitoring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 adaptive basic immunology, tumour immunology, cancer biology of immune cells, aging, drug testing, infection immunology, autoimmune diseases, arthritis, allergy, and vaccine development against these diseases. The composition and method may be used in monitoring the progression of particular disease, in screening drug treatments for diseases, and in the construction of non-redundant DNA microarrays for different species

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           287
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to substantially pure CD40 splice variant proteins which include tail sequences. Also disclosed is a pharmaceutical composition comprising the protein and a carrier, an in vitro method of detecting whether an individual is expressing the protein, and a method for modulating CD40-CD154 interactions in an individual. The protein of the invention is useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating confosition for modulating CD40-disease, cancer, atherosclerosis or acute injury. The current sequence represents CD40 wild-type protein encoding DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protein, useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                <u> hideircaicidecricidadiácarcircidadacideridecidacedecidicarca</u>

```
CD40 encodes a cell surface antigen involved in cell mediated immunity. This DNA can be expressed in a vector which transforms COS cells. The vector can isolate any protein, and clones are easy to manipulate. (Updated on 31-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TGCCAGCCAGGAAGCCGACTGACAAGCCACTGCACAGCTCTTGAGAAGACCCAATGCCAC 180
